1. GENERAL DESCRIPTION

1.1 OVERVIEW

G215HCJ-LH1 is a 21.5" TFT Liquid Crystal Display IAV module with WLED Backlight unit and 30 pins 2ch-LVDS interface. This module supports 1920 x 1080 Full HD mode and can display up to 16.7M colors. The converter module for Backlight is built in.

1.2 FEATURE

- FHD (1920 x 1080 pixels) resolution
- Wide operating temperature.
- RoHS compliance

1.3 APPLICATION

- TFT LCD Monitor
- Factory Application
- Amusement

1.4 GENERAL SPECIFICATIONS

2. ABSOLUTE MAXIMUM RATINGS

2.1 ABSOLUTE RATINGS OF ENVIRONMENT

Item	Symbol	Value		Unit	Note
		Min.	Max.		
Operating Ambient Temperature	T _{OP}	-30	+80	°C	(1)(2)
Storage Temperature	T _{ST}	(-30)	(+80)	°C	

Note (1) Temperature and relative humidity range is shown in the figure below

- (a) 90 %RH Max.
- (b) Wet-bulb temperature should be 39 °C Max.
- (c) No condensation.

Note (2) Panel surface temperature should be 0°C min. and 80°C max under V_{CC}=5.0V, f_r =60Hz, typical LED string current, 25°C ambient temperature, and no humidity control . Any condition of ambient operating temperature ,the surface of active area should be keeping not higher than 80°C.(Panel surface temperature)

2.2 ELECTRICAL ABSOLUTE RATINGS

2.2.1 TFT LCD MODULE

Item	Symbol	Value		Unit	Note
		Min.	Max.		
Power Supply Voltage	VCC	-0.3	6.0	V	(1)

2.2.2 BACKLIGHT UNIT

Item	Symbol	Value		Unit	Note
		Min.	Max.		
Converter Voltage	V _i	-0.3	26.4	V	(1) , (2)
Enable Voltage	EN	-0.3	5.5	V	
Backlight Adjust	Dimming	-0.3	5.5	V	

Note (1) Permanent damage to the device may occur if maximum values are exceeded. Function operation should be restricted to the conditions described under Normal Operating Conditions.

Note (2) Specified values are for LED (Refer to 3.2 for further information).

3. ELECTRICAL CHARACTERISTICS

3.2 BACKLIGHT UNIT

Parameter		Symbol	Value			Unit	Note
			Min.	Typ.	Max.		
Converter Input Voltage		V_i	10.8	12.0	13.2	V_{DC}	(Duty 100%)
Converter Input Ripple Voltage		V_{iRP}	-	-	500	mV	
Converter Input Current		I_i	2.6	3.3	4.0	A_{DC}	@ $V_i = 12V$ (Duty 100%)
Converter Inrush Current		I_{iRUSH}	-	-	10.0	A	@ V_i rising time=10ms ($V_i=12V$)
Input Power Consumption		P_i	-	40		W	(1)
EN Control Level	Backlight on	ENLED (BLON)	2.0	3.3	5.0	V	
	Backlight off		0	-	0.3	V	
PWM Control Level	PWM High Level	Dimming (E_PWM)	2.0	-	5.0	V	
	PWM Low Level		0	-	0.15	V	
PWN Noise Range		V_{Noise}	-	-	0.1	V	
PWM Control Frequency		f_{PWM}	190	200	20k	Hz	(3)
PWM Dimming Control Duty Ratio		-	5	-	100	%	(3), @ $190Hz < f_{PWM} < 1kHz$
			20	-	100	%	(2), @ $1kHz \leq f_{PWM} < 20kHz$
LED Life Time		L_{LED}	50,000		-	Hrs	(2)

Note (1) LED current is measured by utilizing a high frequency current meter as shown below:

Note (2) The lifetime of LED is estimated data and defined as the time when it continues to operate under the conditions at $T_a = 25 \pm 2^\circ\text{C}$ and Duty 100% until the brightness becomes $\leq 50\%$ of its original value. Operating LED at high temperature condition will reduce life time and lead to color shift.

Note (3) At 190 ~1kHz PWM control frequency, duty ratio range is restricted from 5% to 100%.

1K ~20kHz PWM control frequency, duty ratio range is restricted from 20% to 100%.

If PWM control frequency is applied in the range from 1KHz to 20KHZ, The “non-linear” phenomenon on the Backlight Unit may be found. So It's a **suggestion** that PWM control frequency should be **less than 1KHz**.

6. INTERFACE TIMING

6.1 INPUT SIGNAL TIMING SPECIFICATIONS

The input signal timing specifications are shown as the following table and timing diagram.

Signal	Item	Symbol	Min.	Typ.	Max.	Unit	Note
LVDS Clock	Frequency	F _c	58.54	74.25	97.98	MHz	-
	Period	T _c	-	13.47	-	ns	
	Input cycle to cycle jitter	T _{rcj}	---	---	200	ns	(a)
	Input Clock to data skew	TLVCCS	-0.02*T _c	-	0.02*T _c	ps	(b)
	Spread spectrum modulation range	F _{clk_in_mod}	0.987*F _c	---	1.013*F _c	MHz	(c)
	Spread spectrum modulation frequency	F _{SSM}	---	---	200	KHz	
Vertical Display Term	Frame Rate	Fr	50	60	75	Hz	T _v =T _{vd} +T _{vb}
	Total	T _v	1110	1125	1220	Th	-
	Active Display	T _{vd}	1080	1080	1080	Th	-
	Blank	T _{vb}	T _v -T _{vd}	45	T _v -T _{vd}	Th	-
Horizontal Display Term	Total	T _h	1050	1100	1150	Tc	T _h =T _{hd} +T _{hb}
	Active Display	T _{hd}	960	960	960	Tc	-
	Blank	T _{hb}	T _h -T _{hd}	140	T _h -T _{hd}	Tc	-

Note (1) Because this module is operated by DE only mode, Hsync and Vsync input signals should be set to low logic level or ground. Otherwise, this module would operate abnormally.

Note (2) The T_v(T_{vd}+T_{vb}) must be integer, otherwise, the module would operate abnormally.

INPUT SIGNAL TIMING DIAGRAM

TIMING DIAGRAM of LVDS

Note (a) The input clock cycle-to-cycle jitter is defined as below figures. $T_{rcl} = |T1 - T|$

Note (b) Input Clock to data skew is defined as below figures.

Note (c) The SSCG (Spread spectrum clock generator) is defined as below figures.

6.2 POWER ON/OFF SEQUENCE

To prevent a latch-up or DC operation of LCD assembly, the power on/off sequence should be as the diagram below.

Parameter	Value			Units
	Min	Typ	Max	
T1	0.5	-	10	ms
T2	0	-	50	ms
T3	0	-	50	ms
T4	500	-	-	ms
T5	450	-	-	ms
T6	200	-	-	ms
T7	10	-	100	ms
T8	10	-	-	ms
T9	10	-	-	ms
T10	20	-	50	ms

Note:

- (1) The supply voltage of the external system for the module input should be the same as the definition of Vcc.
- (2) When the backlight turns on before the LCD operation of the LCD turns off, the display may momentarily become abnormal screen.
- (3) In case of VCC = off level, please keep the level of input signals on the low or keep a high impedance.
- (4) T4 should be measured after the module has been fully discharged between power off and on period.
- (5) Interface signal shall not be kept at high impedance when the power is on.
- (6) INX won't take any responsibility for the products which are damaged by the customers not following the Power Sequence.
- (7) There might be slight electronic noise when LCD is turned off (even backlight unit is also off). To avoid this symptom, we suggest "Vcc falling timing" to follow "T7 spec".

6.3 SCANNING DIRECTION

The following figures show the image see from the front view. The arrow indicates the direction of scan.

Definition :

Grayscale Maximum : Grayscale 255 (10 bits: grayscale 1023 ; 8 bits : grayscale 255 ; 6 bits: grayscale 63)

White : Luminance of Grayscale Maximum (All R,G,B)

Black : Luminance of grayscale 0 (All R,G,B)

Note (1) Definition of Viewing Angle (θ_x , θ_y):

Note (2) Definition of Contrast Ratio (CR):

The contrast ratio can be calculated by the following expression at center point.

$$\text{Contrast Ratio (CR)} = \text{White} / \text{Black}$$

Note (3) Definition of Response Time (T_R , T_F):

Note (4) Definition of Luminance of White (L_c):

Measure the luminance of White at center point.

Note (5) Measurement Setup:

The LCD module should be stabilized at given temperature to avoid abrupt temperature change during measuring. In order to stabilize the luminance, the measurement should be executed after lighting Backlight for 40 minutes in a windless room. The measurement placement of module should be in accordance with module drawing.

Note (6) Definition of White Variation (δW):

Measure the luminance of White at 9 points.

Luminance of White : $L(X)$, where X is from 1 to 9.

$$\delta W = \frac{\text{Minimum [} L(1) \text{ to } L(9) \text{]}}{\text{Maximum [} L(1) \text{ to } L(9) \text{]}} \times 100\%$$

Low Temperature Operation Test	-30°C, 240 hours	
High Temperature & High Humidity Operation Test	60°C, RH 90%, 240 hours	
ESD Test (Operation)	150pF, 330Ω, 1 sec/cycle Condition 1 : panel contact, ± 8 KV Condition 2 : panel non-contact ± 15 KV	(1), (4)
Shock (Non-Operating)	50G, 11ms, half sine wave, 1 time for $\pm X$, $\pm Y$, $\pm Z$ direction	(2), (3)
Vibration (Non-Operating)	1.5G, 10 ~ 300 Hz sine wave, 10 min/cycle, 3 cycles each X, Y, Z direction	

Note (1) There should be no condensation on the surface of panel during test ,

Note (2) Temperature of panel display surface area should be 80°C Max.

Note (3) At testing Vibration and Shock, the fixture in holding the module has to be hard and rigid enough so that the module would not be twisted or bent by the fixture.

Note (4) In the standard conditions, there is no function failure issue occurred. All the cosmetic specification is judged before reliability test.

Note (5) Before cosmetic and function test, the product must have enough recovery time, at least 24 hours at room temperature.

9. PACKAGING

9.1 PACKING SPECIFICATIONS

- (1) 8 LCD modules / 1 Box
- (2) Box dimensions: 567(L) X 301(W) X 376(H) mm
- (3) Weight: approximately: TBDkg (8 modules per box)

9.2 PACKING METHOD

Figure. 9-1 Packing method

10. DEFINITION OF LABELS

10.1 INX MODULE LABEL

The barcode nameplate is pasted on each module as illustration, and its definitions are as following explanation.

Note (1) Safety Compliance(UL logo) will open after C1 version.

(a) Model Name: G215HCJ-LH1

(b) * * * * : Factory ID

(c) Serial ID: X X X X X X Y M D X N N N N

Serial ID includes the information as below:

(a) Manufactured Date: Year: 1~9, for 2021~2029

Month: 1~9, A~C, for Jan. ~ Dec.

Day: 1~9, A~Y, for 1st to 31st, exclude I, O and U

(b) Revision Code: cover all the change

(c) Serial No.: Manufacturing sequence of product

11. PRECAUTIONS

11.1 ASSEMBLY AND HANDLING PRECAUTIONS

- (1) The module should be assembled into the system firmly by using every mounting hole. Be careful not to twist or bend the module.
- (2) While assembling or installing modules, it can only be in the clean area. The dust and oil may cause electrical short or damage the polarizer.
- (3) Use fingerstalls or soft gloves in order to keep display clean during the incoming inspection and assembly process.
- (4) Do not press or scratch the surface harder than a HB pencil lead on the panel because the polarizer is very soft and easily scratched.
- (5) If the surface of the polarizer is dirty, please clean it by some absorbent cotton or soft cloth. Do not use Ketone type materials (ex. Acetone), Ethyl alcohol, Toluene, Ethyl acid or Methyl chloride. It might permanently damage the polarizer due to chemical reaction.
- (6) Wipe off water droplets or oil immediately. Staining and discoloration may occur if they left on panel for a long time.
- (7) If the liquid crystal material leaks from the panel, it should be kept away from the eyes or mouth. In case of contacting with hands, legs or clothes, it must be washed away thoroughly with soap.
- (8) Protect the module from static electricity, it may cause damage to the C-MOS Gate Array IC.
- (9) Do not disassemble the module.
- (10) Do not pull or fold the lamp wire.
- (11) Pins of I/F connector should not be touched directly with bare hands.

11.2 STORAGE PRECAUTIONS

- (1) When storing for a long time, the following precautions are necessary.
 - (a) Store them in a dark place. Do not expose the module to sunlight or fluorescent light. Keep the temperature between 5°C and 30°C at humidity 50+-10%RH.
 - (b) The polarizer surface should not come in contact with any other object.
 - (c) It is recommended that they be stored in the container in which they were shipped.
 - (d) Storage condition is guaranteed under packing conditions.
 - (e) The phase transition of Liquid Crystal in the condition of the low or high storage temperature will be recovered when the LCD module returns to the normal condition
- (2) High temperature or humidity may reduce the performance of module. Please store LCD module within the specified storage conditions.
- (3) It is dangerous that moisture come into or contacted the LCD module, because the moisture may damage LCD module when it is operating.
- (4) It may reduce the display quality if the ambient temperature is lower than 10 °C. For example, the response time will become slowly, and the starting voltage of lamp will be higher than the room temperature.

11.3 OTHER PRECAUTIONS

- (1) Normal operating condition
 - (a) Display pattern: dynamic pattern (Real display)
 - (Note) Long-term static display can cause image sticking.
- (2) Operating usages to protect against image sticking due to long-term static display
 - (a) Static information display recommended to use with moving image.
- (3) Abnormal condition just means conditions except normal condition.

12. MECHANICAL CHARACTERISTICS

Appendix. SYSTEM COVER DESIGN NOTICE

1	Set Chassis and IAVM Module touching Mode
	 The diagrams illustrate three methods of connecting a green 'Module' to a yellow 'Chassis': Top Diagram (Red X): Shows a 'spring' mechanism at the contact point between the module and chassis. This method is not recommended. Middle Diagram (Black Triangle): Shows 'Flat sheetmetal' at the contact point. This is a suggested method. Bottom Diagram (Blue Circle): Shows an 'EMI Shielding Gasket (Tape/ Sponge)' at the contact point. This is also a suggested method.
Definition	a. To prevent from abnormal display & white spot after mechanical test, it is not recommended to use spring type chassis. b. We suggest the contact mode between Chassis and Module rear cover is Tape/Sponge, second is Flat sheet metal type chassis.

2	Tape/Sponge design on system inner surface
	 The diagrams illustrate the correct and incorrect placement of Tape/Sponge on the system inner surface. The top diagram shows a cross-section of a Module (green) mounted on a Chassis (orange) with Tape/Sponge (red) at the interface, surrounded by a System rear bezel (cyan). Below are two top-down views of a Module. The middle view, marked with a red 'X', shows four separate L-shaped Tape/Sponge pieces at the corners. The bottom view, marked with a blue circle, shows a single rectangular Tape/Sponge piece covering the entire interface area.
Definition	a. To prevent from abnormal display & white spot after mechanical test, we suggest using Tape/Sponge as medium between chassis and Module rear cover could reduce the occurrence of white spot. b. When using the Tape/Sponge, we suggest it be lay over between set chassis and Module rear cover. It is not recommended to add Tape/Sponge in separate location. Since each Tape/Sponge may act as pressure concentration location.

3	System inner surface examination
	
Definition	a. The hatch area on Module PCBA should keep at least 1mm gap(X,Y,Z direction) to any structure with system cover inner surface. b. Burr, Step, PCB protrusion may cause stress concentration. White spot may occur during reliability test.

4	Material used for system rear-cover
	
Definition	System rear-cover material with high rigidity is needed to resist deformation during scuffing test, hinge test, pogo test or backpack test. Abnormal display, white spot, pooling issue may occur if low rigidity material is used. Pooling issue may occur because screw's boss position for module's bracket are deformed open-close test. Solid structure design of system rear-cover may also influence the rigidity of system rear-cover. The deformation of system rear-cover should not caused interference.

5	Assembly SOP examination for system front-cover with hook structure
	
Definition	To prevent panel crack during system front-cover assembly process with hook structure, it is not recommended to press panel or any location that relate directly to the panel.

6	Permanent deformation of system cover after reliability test
	System front-cover System rear-cover Module deformation deformation deformation deformation 0 gap deformation
Definition	System cover including front cover and rear cover may deform during reliability test. Permanent deformation of system front cover and rear cover after reliability test should not interfere with panel. Because it may cause issue such as pooling, abnormal display, white spot and also cell creak. Note: If the interference cannot be avoided, please feel free to contract INX FAE Engineer for collaboration design. We can help to verify and pass risk assessment for customer reference.

7	Design gap A between panel & any components on system rear-cover
	
Definition	System cover including front cover and rear cover may deform during reliability test. Permanent deformation of system front cover and rear cover after reliability test should not interfere with panel. Because it may cause issue such as pooling, abnormal display, white spot and also cell creak. Note: If the interference cannot be avoided, please feel free to contract INX FAE Engineer for collaboration design. We can help to verify and pass risk assessment for customer reference.

8	Design gap B between system front-cover & panel surface
	
Definition	Gap between system front-cover & panel surface is needed to prevent pooling or glass broken. Zero gap or interference such as burr and warpage from mold frame may cause pooling issue near system front-cover opening edge. This phenomenon is obvious during swing test, hinge test, knock test or during pooling inspection procedure. To remain sufficient gap, design with system rib higher than maximum panel thickness is recommended. Note: If the interference cannot be avoided, please feel free to contract INX FAE Engineer for collaboration design. We can help to verify and pass risk assessment for customer reference.

9	Design gap C between panel & system front-cover or protrusions
	 The diagrams illustrate the required gap C between the module and the system front-cover or protrusions. The top diagram shows a module (green rectangle) with a system front-cover (blue T-shape) and system rear-cover (cyan T-shape). A gap C is indicated between the module and the front-cover. The bottom diagram shows a module (green rectangle) with a system front-cover (blue T-shape) and system rear-cover (cyan T-shape). A gap C is indicated between the module and the front-cover.
Definition	Gap between panel & system front-cover or protrusions is needed to prevent shock test failure. Because system front-cover or protrusions with small gap may hit panel during the test. Issue such as cell crack, abnormal display may occur. The gap should be large enough to absorb the maximum displacement during the test. Note: If the interference cannot be avoided, please feel free to contract INX FAE Engineer for collaboration design. We can help to verify and pass risk assessment for customer reference.

10	Design distance between TP AA to LCD AA
 The diagram illustrates a cross-section of a display module assembly. At the top is a grey layer labeled 'TP'. Below it is a thin black layer labeled 'TP INK'. Underneath the TP INK is a blue layer labeled 'Sponge'. Below the sponge is a green L-shaped structure labeled 'MODULE Frame'. To the left of the frame, there are several horizontal layers of different colors (light blue, dark blue, purple, orange, green, pink, and dark green). A red double-headed arrow labeled 'TP VA' indicates the distance between two vertical dashed red lines. The left dashed line is labeled 'LCD AA' and the right dashed line is labeled 'MODULE Frame Opening'.	
Definition	TP VA should avoid TP ink area covering LCD AA or causing the module frame to be exposed.

11	Use OCR Lamination
	 The diagram illustrates the correct use of OCR lamination to avoid line pooling. It shows a cross-section of a display module with a 'Display Area' and 'Line pooling' indicated by red arrows. The bottom part shows the same module with 'TP or Cover Glass' and 'OCR' layers, and a callout showing 'OCR overflow' and 'Add Side glue'.
Definition	1.OCR glue as possible beyond module, in order to avoid Line Pooling 2.Add side glue to avoid Line Pooling
